# 1 Introduction

SCHEMATA is a web forms handling library for Common Lisp.

Although it is potentially framework agnostic, it runs on top of Hunchentoot at the moment.

It features:

- Several form field types: String, boolean, integer, email, password fields. And more.
- Custom fields. SCHEMATA is extensible and it is possible to define new field types.
- Server and client side validation
- Rendering backends. Forms can be rendered via CL-WHO, or Djula, or something else; the backend is pluggable. The default renderer is CL-WHO.
- Themes (like Bootstrap)
- Control on rendering and layout.
- Handling of form errors.
- CSRF protection

## 2 Installation

With Quicklisp:

```
(ql:quickload "schemata")
```

When you want to use a form renderer such as `:who` or `:djula`, quickload the associated package: `schemata.who`, `schemata.who.bootstrap`, `schemata.djula`.

## 3 Usage

### 3.1 Basics

## 4 API

### 4.1 SCHEMATA package

SCHEMATA [PACKAGE]

#### External definitions

##### Macros

SCHEMATA:SCHEMA (*schema-def*) [Macro]  
 Wrapper macro for schema definitions.

SCHEMATA:DEFINE-SCHEMA (*name schema*) [Macro]  
 Register SCHEMA under NAME. The schema can then be accessed via  
 FIND-SCHEMA.

##### Generic functions

SCHEMATA:PARSE-WITH-SCHEMA (*schema string-or-data*) [Generic-Function]  
 Parses the string to an association list using the schema

SCHEMATA:ATTRIBUTE-NAME (*sb-pcl::object*) [Generic-Function]

SCHEMATA:UNSERIALIZE-WITH-SCHEMA (*schema data format*) [Generic-Function]

SCHEMATA:SCHEMA-DOCUMENTATION (*sb-pcl::object*) [Generic-Function]

SCHEMATA:OBJECT-CLASS (*sb-pcl::object*) [Generic-Function]

SCHEMATA:ATTRIBUTE-PARSER (*sb-pcl::object*) [Generic-Function]

SCHEMATA:ATTRIBUTE-VALIDATOR (*sb-pcl::object*) [Generic-Function]

SCHEMATA:ATTRIBUTE-ADD-VALIDATOR (*sb-pcl::object*) [Generic-Function]

SCHEMATA:ATTRIBUTE-EXTERNAL-NAME (*sb-pcl::object*) [Generic-Function]

SCHEMATA:SCHEMA-TYPE (*sb-pcl::object*) [Generic-Function]

SCHEMATA:ATTRIBUTE-FORMATTER (*sb-pcl::object*) [Generic-Function]

SCHEMATA:OBJECT-NAME (*sb-pcl::object*) [Generic-Function]

SCHEMATA:OBJECT-ATTRIBUTES (*sb-pcl::object*) [Generic-Function]

SCHEMATA:ATTRIBUTE-ACCESSOR (*sb-pcl::object*) [Generic-Function]

SCHEMATA:ATTRIBUTE-TYPE (*sb-pcl::object*) [Generic-Function]

## Functions

**SCHEMATA:ATTRIBUTE-READER** (*attribute*) [Function]

**SCHEMATA:POPULATE-WITH-SCHEMA** (*schema object data &key exclude*) [Function]

Populate CLOS objects from data + schema. Attributes members of EXCLUDE parameter are not populated.

**SCHEMATA:SCHEMA-CLASS-SCHEMA** (*schema-class*) [Function]

Generate a schema using the schema class meta info

**SCHEMATA:SERIALIZE-WITH-SCHEMA** (*schema input &optional (serializer generic-serializer::\*serializer\*) (stream generic-serializer::\*serializer-output\*)*) [Function]

**SCHEMATA:SCHEMA-SPEC** (*schema*) [Function]

**SCHEMATA:ATTRIBUTE-TYPE-NAME** (*attribute*) [Function]

**SCHEMATA:VALIDATION-ERROR** (*message &rest args*) [Function]

**SCHEMATA:VALIDATE-WITH-SCHEMA** (*schema data &key (collect-errors \*collect-validation-errors\*) (error-p \*signal-validation-errors\*)*) [Function]

Validate input using schema. Useful for validating resource operations posted content (for :post and :put methods). Input can be a string or an association list.

Args: - schema (symbol or schema): The schema - data (alist): The data to validate. - format (keyword): The data format. - collect-errors (boolean): If true, collect all the validation errors. If false, return the first validation error found. Default: true. - error-p (boolean): If true, when validation errors are found, a validation error is signaled. If false, the validation errors are returned as the function result and no error is signaled.

**SCHEMATA:ATTRIBUTE-OPTIONAL-P** (*attribute*) [Function]

**SCHEMATA:ATTRIBUTE-WRITER** (*attribute*) [Function]

**SCHEMATA:FIND-OBJECT-ATTRIBUTE** (*object attribute-name &key (error-p t)*) [Function]

**SCHEMATA:FIND-SCHEMA** (*name &optional (errorp t)*) [Function]

Find a schema definition by name

**SCHEMATA:PATCH-WITH-SCHEMA** (*schema object data*) [Function]

Populate CLOS objects from data + schema. Only populates attributes available in DATA, validating them. Useful for PATCH rest api operations implementations. DATA should be an association list.

## Classes

**SCHEMATA:OBJECT-SCHEMA** [Class]

Class precedence list: `object-schema`, `schema`, `standard-object`, `t`

Slots:

- **name** — initarg: :name; reader: schemata:object-name; writer: (setf schemata:object-name)  
The name of the object.
- **attributes** — initarg: :attributes; reader: schemata:object-attributes; writer: (setf schemata:object-attributes)
- **class** — initarg: :class; reader: schemata:object-class; writer: (setf schemata:object-class)
- **ignore-unknown-attributes** — initarg: :ignore-unknown-attributes; reader: schemata::ignore-unknown-attributes; writer: (setf schemata::ignore-unknown-attributes)
- **serializer** — initarg: :serializer; reader: schemata::object-serializer; writer: (setf schemata::object-serializer)
- **unserializer** — initarg: :unserializer; reader: schemata::object-unserializer; writer: (setf schemata::object-unserializer)

**SCHEMATA:SCHEMA-REFERENCE-SCHEMA** [Class]

Class precedence list: schema-reference-schema, schema, standard-object, t

Slots:

- **name** — initarg: :schema-name; reader: schemata::schema-name; writer: (setf schemata::schema-name)

**SCHEMATA:SCHEMA** [Class]

Class precedence list: schema, standard-object, t

Slots:

- **documentation** — initarg: :documentation; reader: schemata:schema-documentation; writer: (setf schemata:schema-documentation)

**SCHEMATA:VALIDATION-ERROR** [Class]

Class precedence list: validation-error, error, serious-condition, condition, t

**SCHEMATA:ATTRIBUTE** [Class]

Class precedence list: attribute, schema, attribute-properties, standard-object, t

Slots:

- **name** — initarg: :name; reader: schemata:attribute-name; writer: (setf schemata:attribute-name)
- **type** — initarg: :type; reader: schemata:attribute-type; writer: (setf schemata:attribute-type)
- **accessor** — initarg: :accessor; reader: schemata:attribute-accessor; writer: (setf schemata:attribute-accessor)
- **writer** — initarg: :writer
- **reader** — initarg: :reader
- **slot** — initarg: :slot; reader: schemata::attribute-slot; writer: (setf schemata::attribute-slot)

SCHEMATA:TYPE-SCHEMA [Class]

Class precedence list: type-schema, schema, standard-object, t

Slots:

- type — initarg: :type; reader: schemata:schema-type; writer: (setf schemata:schema-type)

SCHEMATA:SCHEMA-OBJECT [Class]

Class precedence list: schema-object, standard-object, t

SCHEMATA:SCHEMA-CLASS [Class]

Metaclass for schema objects

Class precedence list: schema-class, standard-class, class, specializer, metaobject, standard-object, t

Slots:

- schema-name — initarg: :schema-name; reader: schemata::schema-name; writer: (setf schemata::schema-name)
